

Breast Cancer Screening (BCS-E)

BCS-E Measure Description¹

This HEDIS measure assesses women 40–74 years of age who had at least one mammogram to screen for breast cancer in the past two years.

Why is BCS-E Important?¹

Aside from some forms of skin cancer, breast cancer is the most common cancer among American women, regardless of race or ethnicity. Screening can improve outcomes: Early detection reduces the risk of dying from breast cancer and can lead to a greater range of treatment options and lower health care costs.

Best Practices

- ✓ Educate patients on the importance of routine screenings and how it helps lower the risk of dying from breast cancer.
- ✓ Educate patients on mammograms and the recommended frequency of at least once every 24 months for women 40-74 years old.
- ✓ Provide a list of locations where mammogram screenings can be performed.
- ✓ Review completed screening dates and document all patient reported mammograms, using exact dates such as month and year.
- ✓ Discuss fears patients may have about mammograms and the different ways of testing available to them.
